Software Requirements Specification (SRS) Standards

RCS 305 ? Software Engineering | Riara University Revision Resource

1. Purpose & Stakeholder Audience

An SRS serves as the authoritative legal and engineering contract between customers, development teams, quality assurance testers, and project managers. It establishes the verifiable baseline against which all final deliverables are evaluated.

2. IEEE 830 / ISO/IEC/IEEE 29148 Standard Structure

Standard SRS templates partition documentation into three principal divisions:
? 1. Introduction: Purpose, document conventions, intended audience, project scope, and authoritative references.
? 2. Overall Description: Product perspective, user classes and characteristics, operating environment, design constraints, and assumptions.
? 3. Specific System Requirements: Detailed functional requirements, external interface specifications (UI, hardware, software, communications), and performance requirements.

3. Quality Attributes of Exemplary Specifications

Every SRS requirement statement must exhibit six essential characteristics: Unambiguous (single interpretation), Complete (all scenarios addressed), Consistent (no mutually conflicting requirements), Verifiable (demonstrable through test cases), Modifiable (structured for change), and Traceable (linked from business need to source code).
